

# New Model edp<sup>®</sup> Polybagger

edp<sup>®</sup> has just completed a series upgrade of its 1-6kg Poly Bag Filling and Sealing Machine.

The main issues, to mention just a few, were to be able to hold both 127mm and 178mm wicket centres without head changes, to give the operator easier control of the different functions available, ie, Soft Fill Mode, Blow or Vacuum Bag Opening, Bag Filling Programs selection and more technical information for a service person, maintaining the machine when necessary.

Other advantages achieved include an increase in bagging capacity of up to 20%, a far more efficient Vacuum System, less complex, but very reliable. The Vacuum is used when filling freshnet bags.

The addition of extra No Bag/ No Fill protection, as well as a Bag Closure fault. The machine now holds product if it runs out of bags until a new wicket is loaded.

Multiple bag size programs are now accessed via a new touch screen, the number of stored programs has been increased.

The Infeed Conveyor (part of the machine) has been completely redesigned to eliminate any bridging on larger product, but also suit double feed belts from weigher with Dual Cross Belts.

The new bag gate can now cater from 1-6kg bags without adjustment.
